BOOKING PRICE SETUP

Booking Fees

Description: A fixed fee applied to every order once a booking is created. This fee is charged regardless of the distance or duration of the trip and is intended to cover initial operational costs.

Example: For every new ride booked in the app, a fixed booking fee of \$2.00 is charged. This fee is added to the customer's total fare as soon as they confirm their ride.

Drivers Profit in Booking fees amount:

Description: The percentage or absolute amount of the booking fee that will go to the driver.

Example: If the booking fee is ₹50 and the driver's profit is set to 80%, the driver will earn ₹40 from the booking fee.

Allow Outside Pickup Business (On/Off):

Description: This setting determines whether the driver can accept bookings that originate outside the designated business area. When turned on, it allows bookings outside the standard operating zone.

Example: If this option is turned on, and the business operates only within Ahmedabad, a driver can still accept a ride starting from Gandhinagar, a neighbouring area.

Allow Outside Price Applicable for destination (On/Off):

Description: This setting determines if the ride's destination can be outside the designated business area. When enabled, rides to destinations outside the usual operating zone are allowed, and the **"Booking Fees at Outside"** pricing will apply for these trips.

Example: If a business operates within Mumbai and this option is turned on, a customer can book a ride with a destination outside Mumbai, such as Pune. The **"Booking Fees at Outside"** rate, rather than the standard booking fee, will be applied.

Booking Fees at outside amount:

Description: When rides are accepted outside the city business area, a separate booking fee can be charged. This can be different from the regular booking fee for inside-area rides.

Example: If the standard booking fee inside the business area is ₹50, the outside-area booking fee could be set at ₹100.

Driver Profit in Booking Fees at outside amount:

Description: The profits the driver will earn for bookings outside the city business area.

Example: If the outside booking fee is ₹100 and the driver's profit is set at 80%, the driver will earn ₹80 from the booking.

Examples to Clarify the Impact of Booking Price Settings:

Example 1: Regular Booking Fee

Scenario: The business operates in Delhi, and the booking fee is set at ₹40 with a driver profit of 70%.

Impact: Every customer booking a ride within Delhi will pay ₹40 upfront, and the driver will earn ₹28 from this fee.

Example 2: Outside Pickup Business Enabled

Scenario: The business is based in Bengaluru, and the admin has enabled the **"Outside Pickup Business"** option with an outside booking fee of ₹120.

Impact: A customer requesting a ride from Mysuru (**outside the Bengaluru business area**) will be charged ₹120, and the driver will receive a profit based on the outside booking fee.

Example 3: Driver Profit on Regular Booking

Scenario: In Ahmedabad, the booking fee is ₹60, and the driver receives a 75% profit on this fee.

Impact: For every ride booked, the driver will earn ₹45 from the booking fee.

Example 4: Different Fees for Outside Destinations

Scenario: The business operates in Pune, but a ride is requested from Pune to Satara (outside the business area). The admin has allowed outside destination bookings and set an additional ₹150 as the outside-area booking fee.

Impact: The customer booking a ride from Pune to Satara will be charged an extra ₹150 on top of the regular booking fee. The driver will earn a percentage or a fixed amount from this additional fee, as configured by the admin.

Example 5: Custom Profit for Outside Bookings

Scenario: In Chennai, the standard booking fee is ₹80, and the outside-area booking fee is ₹200. The admin has set the driver's profit to 90% for outside bookings.

Impact: For an outside booking, the customer will be charged ₹200, and the driver will earn ₹180, providing more incentive for drivers to accept trips outside the usual business area.

DISTANCE PRICE SETUP

Distance Price refers to the fare charged based on the distance travelled during a ride. This pricing mechanism allows the admin to set a base fare for a specified distance and then charge an additional price for every kilometre beyond the base distance. The system can be configured to apply distance-based pricing both within and outside the business area, with customizable driver profits and slot pricing options.

Where to configure: Navigate to **Business > City > City Setting > Vehicle Price > Add Vehicle Price "+" > Set Country, city, Price Type, vehicle type> Normal Price Type > Distance Price**

Normal and Outside:

Distance prices have 2 options for set pricing, Normal and Outside. We will understand Normal pricing setup, outside is same pricing setup but you can set different data for that.

Enable/Disable Distance Pricing

Description: This feature allows the admin to turn on or off the distance-based pricing for the service. When disabled, the system will not consider distance pricing.

Driver Profit Configuration

Description: The admin can choose how to calculate driver profit, either as a percentage of the distance charge or as an absolute value.

Percentage: A certain percentage of the total distance fare goes to the driver as profit.

Absolute: A fixed amount from each fare segment or unit goes to the driver as profit.

Base Price and Base Distance

Description: The base price applies up to a set distance (base distance), after which a different pricing scheme kicks in for additional distance travelled.

Base Price: The price charged for the initial segment of the journey.

Base Distance: The length of the initial journey segment to which the base price applies.

Example: if we want to set as \$5 for the first 2 kilometers.

Base Price: \$5

Base Distance: 2 kilometers.

Unit Distance Price

Description: The price charged per unit distance after the base distance has been exceeded.

Example:

Unit Distance Price: \$1 per kilometer after the first 2 kilometers.

Invoice Calculation:

Example 1: Travel Within the Standard Area Scenario:

Traveling a total of 10 kilometers within the standard area.

Calculation:

Base fare for the first 2 kilometers: \$5.

For the remaining 8 kilometers (10 km - 2 km): 8 kilometers × \$1/km = \$8.

Total Invoice: \$5 (base fare) + \$8 = **\$13.**

Example 2: Travel Within the Standard Area Scenario:

Traveling a total of 13 kilometers within the standard area.

Calculation:

Base fare for the first 2 kilometers: \$5.

For the remaining 11 kilometers (13 km - 2 km): 11 kilometers ×
\$1/km = \$11.

Total Invoice: \$5 (base fare) + \$11 = \$16.

Slot Pricing

Description: This pricing model allows setting different prices for specified distance ranges, providing flexibility to structure fares according to specific segments of a journey.

From Distance to To Distance Set Price: Admin sets prices for different slots or segments.

Driver Profit: Set as absolute values for each slot if needed.

Example:

First Slot (Min to 2 km): \$10

Second Slot (3 to 6 km): \$18

Third Slot (7 to 9 km): \$21

Fourth Slot (10 to Max km): \$30

Fare Calculation Method

Price Add in Sum:

This option adds the total price of each slot covered by the trip.

Slot Price Calculate in Unit Distance:

This option calculates the price for each kilometer within each slot.

If this is enabled, then we have one more option there

Slot Price Calculate in Unit Distance with Total:

This option adds the total price of each slot covered by the trip.

Examples:

SLOT	Calculate in Unit Distance – OFF &	
	Add in Sum - OFF	Add in Sum - ON

From	To	Price	5km	12km	5km	12km		
Min	2	10			10	10		
2	6	30	30		30	30		
6	9	36				36		
9	Max	100		100		100		
Total			30	100	40	176		
SLOT			Calculate in Unit Distance – ON &					
			Add in Sum - OFF		Add in Sum - ON		Unit Distance on Total - ON	
From	To	Price	5km	12km	5km	12km	5km	12km
Min	2	10			20	20		
2	6	30	90		90	120	150	
6	9	36				108		
9	Max	100		300		300		1200
Total			90	300	110	548	150	1200

Calculation Rules:

Price: This is the price for a given slot range without any modifications.

Sum/Add in Sum:

ON: To calculate the price when "Sum" is ON, first determine the total distance covered by the specific slot range. Then, sum the base prices for all the individual slots within that below slot range.

OFF: The base price remains unchanged for the slot range. The pricing calculation does not involve any multipliers based on the number of units or distance; it simply takes the base price listed for that specific slot range.

Unit Distance (ON/OFF):

ON: When "Unit Distance" is ON, the base price is modified based on the total distance covered by the specific slot. The calculation for a slot with a total distance of X and a base price of P is conducted as follows:

Identify the Distance X in minimum and maximum units (slots) within the slot range.

Calculate the price by multiplying the difference between the maximum and minimum units by the base price for the slot covering **distance X**.

The formula is: **(distance X – min slot unit) × base price**

This price applies only to slots that cover the specified distance X between them.

OFF: When "Unit Distance" is OFF, the base price for each slot remains unaffected by the distance.

Unit Distance on Total (ON/OFF):

ON: This is active when "Unit Distance" ON and "**Add in Sum**" OFF. When "Unit Distance on Total" is ON, the base price is modified based on the total distance covered by the specific slot. The calculation for a slot with a total distance of X and a base price of P is conducted as follows:

Identify the Distance X in minimum and maximum units (slots) within the slot range.

Calculate the price by multiplying the by the **base price** for the slot covering **distance X**. The formula is: **distance X × base price**

This price applies only to slots that cover the specified distance X between them.

Example Calculations:

Let's go through the table and calculate each value based on the rules:

Sum OFF & Unit Distance OFF:

Price for 5 km: \$30

Reason: The distance of 5 km falls within the slot range from 2 to 6. The base price listed for this range is \$30, and since both Sum and Unit Distance features are OFF, the price remains as the listed base price without any modifications.

Price for 12 km: \$100

Reason: The distance of 12 km is covered starting from slot 9 up to the maximum slot in this scenario. The base price for this range is \$100. With both Sum and Unit Distance OFF, there is no alteration to the base price; thus, it remains at \$100 as specified for the range covering the maximum slots.

Sum ON & Unit Distance OFF:

Price for 5 km: \$40 :

Reason:

The 5 km distance corresponds to the slot range from 2 to 6, which has a base price of \$30.

Additionally, there is a preceding slot range from 0 to 2 with a base price of \$10.

With "Sum" ON, we add the base prices of all relevant slots: \$30 (for slots 2-6) + \$10 (for slots 0-2) = \$40.

"Unit Distance" is OFF, so the calculation ignores any distance-related factors, focusing only on the sum of the base prices of the relevant slots.

Price for 12 km: \$176 :

Reason:

The 12 km distance includes the slot range from 9 to the maximum, which has a base price of \$100.

Below this range, additional slots contribute to the sum:

Slots 6 to 9 have a base price of \$36.

Slots 2 to 6 have a base price of \$30.

Slots 0 to 2 have a base price of \$10.

Summing all these base prices with "Sum" ON gives: \$100 (for slots 9-max) + \$36 (for slots 6-9) + \$30 (for slots 2-6) + \$10 (for slots 0-2) = \$176.

Since "Unit Distance" is OFF, this calculation only involves summing the base prices of all the slots covered up to the maximum specified distance.

Sum OFF & Unit Distance ON:

Price for 5 km: \$90

Reason:

The distance of 5 km correlates to the slot ranges from 2 to 6.

The base price for this range is \$30.

With "Unit Distance" ON, the calculation adjusts based on the difference in slots covered, specifically from the minimum slot (2) to the target distance (5 km).

Calculate the price using the formula for unit distance: $(5 - 2) = 3$ slots.

Then multiply this difference by the base price: **3 times \$30 = \$90.**

"Sum" is OFF, so there is no accumulation of base prices across multiple slot ranges; the price calculation strictly involves the multiplication related to the unit distance from the specified minimum slot.

Price for 12 km: \$300

Reason:

The distance of 12 km is covered within the slot range from 9 to the maximum.

The base price listed for this slot range is \$100.

With "Unit Distance" ON, pricing is calculated based on the slot difference relative to the minimum slot in the range (9) up to the target distance (12 km).

Compute the price using the unit distance formula: $(12 - 9) = 3$ slots.

Then, multiply this slot difference by the base price: **3 times \$100 = \$300.**

Since "Sum" is OFF, only the calculation from this specific slot range is considered, focusing exclusively on the adjustment provided by the "Unit Distance".

Sum ON & Unit Distance ON:

Price for 5 km: \$110

Reason:

The distance of 5 km corresponds to the slot range from 2 to 6, with a base price of \$30.

Unit Distance Calculation:

Compute the slot difference from the minimum slot (2) to the target distance (5 km) : $5 - 2 = 3$ slots.

Calculate the unit distance price: **3 times \$30 = \$90.**

Sum Calculation:

Additionally, consider the slot range from 0 to 2 with a base price of \$10.

Calculate the price for these slots assuming 2 slots: 2 times \$10 = \$20.

Sum the results of all slots: \$90 (from slots 2 to 6) + \$20 (from slots 0 to 2) = \$110.

Price for 12 km: \$548

Reason:

The distance of 12 km spans from slot 9 to the maximum limit, with a base price of \$100.

Unit Distance Calculation:

Compute the slot difference from the minimum slot (9) to the target distance (12 km): $12 - 9 = 3$ slots.

Calculate the unit distance price: 3 times \$100 = \$300.

Sum Calculation:

Consider additional slot ranges below this distance:

Slots 6 to 9, assuming 3 slots, with a base price of \$36 : 3 times \$36 = \$108.

Slots 2 to 6, assuming 4 slots, with a base price of \$30: 4 times \$30 = \$120.

Slots 0 to 2, assuming 2 slots, with a base price of \$10: 2 times \$10 = \$20.

Sum the results of all these slots: $\$300 + \$108 + \$120 + \$20 = \$548$.

Sum OFF & Unit Distance ON & Unit Distance on Total ON:

Price for 5 km: \$150

Reason:

The distance of 5 km correlates to the slot ranges from 2 to 6.

The base price for this range is \$30.

With "Unit Distance on Total" ON and "Unit Distance" ON, the calculation is multiplying Distance by the base price: **5km times * \$30 = \$150.**

"Sum" is OFF, so there is no accumulation of base prices across multiple slot ranges; the price calculation strictly involves the multiplication related to the unit distance total.

Price for 12 km: \$1200

Reason:

The distance of 12 km correlates to the slot ranges from 9 to Max. The base price for this range is \$100.

With "Unit Distance on Total" ON and "Unit Distance" ON, the calculation is multiplying Distance by the base price: **12 km times * \$100 = \$1200.**

"Sum" is OFF, so there is no accumulation of base prices across multiple slot ranges; the price calculation strictly involves the multiplication related to the unit distance total.

As the above example you understand properly now for how to calculate pricing in slots. So let's take one more example for total distance is with fractional distance, you can see below. Compare with previous example :

SLOT			Sum OFF & Unit Distance ON		Sum OFF & Unit Distance ON		Sum ON & Unit Distance ON		Sum ON & Unit Distance ON	
Fro m	To	Pric e	5 km	12 km	5.62 km	12.38 km	5 km	12 km	5.62 km	12.38 km

Min	2	10					20	20	20	20
2	6	30	90		108.6		90	120	108.6	120
6	9	36						108		108
9	Max	100		300		338		300		338
Total			90	300	108.6	338	110	548	128.6	586

DISTANCE PRICE SETUP FOR OUTSIDE BOUNDARY

Description: When a ride originates outside of the city boundary, an additional booking fee can be applied to account for the extra costs associated with longer travel distances and the time drivers spend getting back into the city.

It's the same calculation as Normal distance ride.

TIME PRICE SETUP

Time Price refers to the fare charged based on the duration of a ride. This pricing mechanism allows the admin to set a base fare for a specified amount of time and then charge an additional price for every minute (or other time increment) beyond the base duration. The system can be configured to apply time-based pricing both within and outside the business area, with customizable driver profits and slot pricing options.

Where to configure: Navigate to **Business > City > City Setting > Vehicle Price > Add Vehicle Price "+" > Set Country, city, Price Type, vehicle type> Normal Price Type > Time Price**

Normal and Outside:

Time prices have 2 options for set pricing, Normal and Outside. We will understand Normal pricing setup, outside is same pricing setup but you can set different data for that.

Enable/Disable Distance Pricing

Description: This feature allows the admin to turn on or off the time-based pricing for the service. When disabled, the system might not charge time charges.

Driver Profit Configuration

Description: The admin can choose how to calculate driver profit, either as a percentage of the time charge or as an absolute value.

Percentage: A certain percentage of the total time fare goes to the driver as profit.

Absolute: A fixed amount from each fare segment or unit goes to the driver as profit.

Base Price and Base Time

Description: The base price applies up to a set time (base time), after which a different pricing scheme kicks in for additional time travelled.

Base Price: The price charged for the initial segment of the journey.

Base Distance: The length of the initial journey segment to which the base price applies.

Example: if we want to set as \$5 for the first 5 mins.

Base Price: \$5

Base Distance: 5 mins.

Unit Time Price

Description: The price charged per unit time after the base time has been exceeded.

Example:

Unit Time Price: \$1 per min after the first 5 min.

Invoice Calculation:

Example 1: Travel Within the Standard Area Scenario:

Traveling a total of 27 min within the standard area.

Calculation:

Base fare for the first 5 mins: \$10.

For the remaining 22 mins (27min - 5 min) : $22 \text{ min} \times \$1/\text{km} = \22 .

Total Invoice: \$10 (base fare) + \$22 = **\$32**.

Example 2: Travel Within the Standard Area Scenario:

Traveling a total of 13 min within the standard area.

Calculation:

Base fare for the first 3 mins: \$5.

For the remaining 10 mins (13 km - 3 km): $10 \text{ mins} \times \$1/\text{km} = \10 .

Total Invoice: $\$5 \text{ (base fare)} + \$10 = \$15$.

Slot Pricing

Description: This pricing model allows setting different prices for specified time ranges, providing flexibility to structure fares according to specific segments of a journey.

From Distance to To Distance Set Price: Admin sets prices for different slots or segments.

Driver Profit: Set as absolute values for each slot if needed.

Example:

First Slot (Min to 10 min): \$2

Second Slot (10 to 30 min): \$5

Third Slot (30 to 50 min): \$12

Fourth Slot (50 to Max min): \$20

Fare Calculation Method

Price Add in Sum:

This option adds the total price of each slot covered by the trip.

Slot Price Calculate in Unit Time:

This option calculates the price for each min within each slot.

If this is enabled, then we have one more option there

Slot Price Calculate in Unit Time with Total:

This option adds the total price of each slot covered by the trip.

SLOT			Calculate in Unit Distance - OFF &			
			Add in Sum - OFF		Add in Sum - ON	
From	To	Price	27 min	69 min	27 min	69 min
Min	10	2			2	2
10	30	5	5		5	5
30	50	12				12
50	Max	20		20		20
Total			5	20	7	39

SLOT			Calculate in Unit Time - ON					
			Add in Sum - OFF		Add in Sum - ON		Unit Time on Total - ON	
From	To	Price	27 min	69 min	27 min	69 min	27 min	69 min
Min	10	2			20	20		
10	30	5	85		85	100	135	
30	50	12				240		
50	Max	20		380		380		1380
Total			85	380	105	740	135	1380

Calculation Rules:

Price: This is the price for a given slot range without any modifications.

Sum/Add in Sum:

ON: To calculate the price when "Sum" is ON, first determine the total time covered by the specific slot range. Then, sum the base prices for all the individual slots within that below slot range.

OFF: The base price remains unchanged for the slot range. The pricing calculation does not involve any multipliers based on the number of units or time; it simply takes the base price listed for that specific slot range.

Unit Time (ON/OFF):

ON: When "Unit Time" is ON, the base price is modified based on the total time covered by the specific slot. The calculation for a slot with a total time of X and a base price of P is conducted as follows:

Identify the Time X in minimum and maximum units (slots) within the slot range.

Calculate the price by multiplying the difference between the maximum and minimum units by the base price for the slot covering **time X**. The formula is: **(time X – min slot unit) × base price**

This price applies only to slots that cover the specified time X between them.

OFF: When "Unit Time" is OFF, the base price for each slot remains unaffected by the time.

Unit Time on Total (ON/OFF):

ON: This is active when "**Unit Time**" ON and "**Add in Sum**" OFF. When "**Unit Time on Total**" is ON, the base price is modified based on the total time covered by the specific slot. The calculation for a slot with a total time of X and a base price of P is conducted as follows:

Identify the Time X in minimum and maximum units (slots) within the slot range.

Calculate the price by multiplying the by the **base price** for the slot covering **time X**. The formula is: **time X × base price**

This price applies only to slots that cover the specified time X between them.

Example Calculations:

Let's go through the table and calculate each value based on the rules:

Sum OFF & Unit Time OFF:

Price for 27 min: \$5

Reason: The time of 27 min falls within the slot range from 10 to 30. The base price listed for this range is \$5, and since both Sum and Unit Time features are OFF, the price remains as the listed base price without any modifications.

Price for 69 min: \$20

Reason: The time of 69 min is covered starting from slot 50 up to the maximum slot in this scenario. The base price for this range is \$20. With both Sum and Unit Time OFF, there is no alteration to the base price; thus, it remains at \$20 as specified for the range covering the maximum slots.

Sum ON & Unit Time OFF:

Price for 27 min: \$7:

Reason:

The 27 min time corresponds to the slot range from 10 to 30, which has a base price of \$5.

Additionally, there is a preceding slot range from 0 to 10 with a base price of \$2.

With "Sum" ON, we add the base prices of all relevant slots: **\$5 (for slots 10-30) + \$2 (for slots 0-10) = \$7.**

"Unit Time" is OFF, so the calculation ignores any time-related factors, focusing only on the sum of the base prices of the relevant slots.

Price for 69 min: \$39:

Reason:

The 69 min time includes the slot range from 50 to the maximum, which has a base price of \$20.

Below this range, additional slots contribute to the sum:

Slots 30 to 50 have a base price of \$12.

Slots 10 to 30 have a base price of \$5.

Slots 0 to 10 have a base price of \$2.

Summing all these base prices with "Sum" ON gives: **\$20 (for slots 50-max) + \$12 (for slots 30-50) + \$5 (for slots 10-30) + \$2 (for slots 0-10) = \$39.**

Since "Unit Time" is OFF, this calculation only involves summing the base prices of all the slots covered up to the maximum specified time.

Sum OFF & Unit Time ON:

Price for 27 min: \$85

Reason:

The time of 27 min correlates to the slot range from 10 to 30.

The base price for this range is \$5.

With "Unit Time" ON, the calculation adjusts based on the difference in slots covered, specifically from the minimum slot (10) to the target time (27 min).

Calculate the price using the formula for unit time: $(27 - 10) = 17$.

Then multiply this difference by the base price: $17 \text{ times } \$5 = \85 .

"Sum" is OFF, so there is no accumulation of base prices across multiple slot ranges; the price calculation strictly involves the multiplication related to the unit time from the specified minimum slot.

Price for 69 min: \$380

Reason:

The time of 69 min is covered within the slot range from 50 to the maximum.

The base price listed for this slot range is \$20.

With "Unit Time" ON, pricing is calculated based on the slot difference relative to the minimum slot in the range (50) up to the target time (69 km).

Compute the price using the unit time formula: $(69 - 50) = 19$.

Then, multiply this slot difference by the base price: **19 times \$20 = \$380.**

Since "Sum" is OFF, only the calculation from this specific slot range is considered, focusing exclusively on the adjustment provided by the "Unit Time".

Sum ON & Unit Time ON:

Price for 27 min: \$105

Reason:

The time of 27 min corresponds to the slot range from 10 to 30, with a base price of \$5.

Unit Time Calculation:

Compute the slot difference from the minimum slot (10) to the target time (5 km): $27 - 10 = 17$ slots.

Calculate the unit time price: $17 \text{ times } \$5 = \85 .

Sum Calculation:

Additionally, consider the slot range from 0 to 10 with a base price of \$2.

Calculate the price for these slots assuming 2 slots: $2 \text{ times } \$10 = \20 .

Sum the results of all slots: $\$85 \text{ (from slots 10 to 30)} + \$20 \text{ (from slots 0 to 10)} = \mathbf{\$105}$.

Price for 69 time: \$740

Reason:

The time of 69 time spans from slot 50 to the maximum limit, with a base price of \$20.

Unit Time Calculation:

Compute the slot difference from the minimum slot (50) to the target time (15 min): $69 - 50 = 19$ slots.

Calculate the unit time price: $19 \text{ times } \$20 = \380 .

Sum Calculation:

Consider additional slot ranges below this time:

Slots 30 to 50, assuming 20 slots, with a base price of \$12: $20 \text{ times } \$12 = \240 .

Slots 10 to 30, assuming 20 slots, with a base price of \$5: $20 \text{ times } \$5 = \100 .

Slots 0 to 10, assuming 10 slots, with a base price of \$2: $2 \text{ times } \$10 = \20 .

Sum the results of all these slots: $\$380 + \$240 + \$100 + \$20 = \$740$.

Sum OFF & Unit Time ON & Unit Time on Total ON:

Price for 27 min: \$135

Reason:

The time of 27 min correlates to the slot ranges from 10 to 30.

The base price for this range is \$5.

With "**Unit Time on Total**" ON and "**Unit Time**" ON, the calculation is multiplying Time by the base price: $27 \text{ min times } \$5 = \135 .

"Sum" is OFF, so there is no accumulation of base prices across multiple slot ranges; the price calculation strictly involves the multiplication related to the unit distance total.

Price for 69 min: \$1380

Reason:

The time of 69 min correlates to the slot ranges from 50 to Max.

The base price for this range is \$20.

With "**Unit Time on Total**" ON and "**Unit Time**" ON, the calculation is multiplying Time by the base price: **69 min times * \$20 = \$1380.**

"Sum" is OFF, so there is no accumulation of base prices across multiple slot ranges; the price calculation strictly involves the multiplication related to the unit time total.

As the above example you understand properly now for how to calculate pricing in slots. So, let's take one more example for total time is with fractional time, you can see below. Compare with previous example:

SLOT			Sum OFF & Unit Time ON		Sum OFF & Unit Time ON		Sum ON & Unit Time ON		Sum ON & Unit Time ON	
From	To	Price	27 min	69 min	27.25 min	69.70 min	27 min	69 min	27.25 min	69.7 min
Min	10	2					20	20	20	20
10	30	5	85		86.25		85	100	86.25	100
30	50	12						240		240
50	Max	20		380		394		380		394
Total			85	380	86.25	394	105	740	106.25	754

WAITING TIME PRICE SETUP

Waiting Time Price refers to the fare charged based on the duration of a waiting time at Pickup. If Driver/Deliveryman/Provider arrived at pickup point and customer not near or waiting, then that much time count as Waiting time. This pricing mechanism allows the admin to set a free time, base fare for a specified amount of time and then charge an additional price for every minute (or other time increment) beyond the base duration. The system can be configured to apply time-based pricing both within and outside the business area, with customizable driver profits and slot pricing options.

Price Setup:

All pricing is same as TIME PRICE SETUP. In this pricing we added one field as below:

Free time

Description: You can set here N minutes, if you want to give free time for waiting time. It means You will not charge for that min in waiting time and after that remaining mins charges apply accordingly to set pricing.

Example: if you want to set as 5 mins free waiting time.

Free time: 5 mins.

So, in this case if total waiting time is **12 mins** at pickup, then charges will count on **7 mins = 12 mins – 5 mins (Free time)**

STAND BY TIME PRICE SETUP

Stand by Time Price refers to the fare charged based on the duration of a standby time between booking. If Driver/Deliveryman/Provider hold on some place when booking is running. They can click on Pause button for count stand timer and click on resume we will take difference stand by time. This pricing mechanism allows the admin to set a free time, base fare for a specified amount of time and then charge an additional price for every minute (or other time increment) beyond the base duration. The system can be configured to apply time-based pricing both within and outside the business area, with customizable driver profits and slot pricing options.

Price Setup:

All pricing is same as TIME PRICE SETUP. In this pricing we added one field as below:

Free time

Description: You can set here N minutes, if you want to give free time for standby time. It means You will not charge for that min in standby time and after that remaining mins charges apply accordingly to set pricing.

Example: if you want to set as 10 mins free standby time.

Free time: 5 mins.

So, in this case if total standby time is 27 **mins** between booking, then charges will count on **17 mins = 27 mins – 10 mins (Free time)**

TRAFFIC BY TIME PRICE SETUP

Traffic Time Price refers to the fare charged based on the duration of a traffic time between booking. If Driver/Deliveryman/Provider hold on traffic place when booking is running. Traffic time automatically count as setting set by admin. This pricing mechanism allows the admin to set a free time, base fare for a specified amount of time and then charge an additional price for every minute (or other time increment) beyond the base duration. The system can be configured to apply time-based pricing both within and outside the business area, with customizable driver profits and slot pricing options.

All pricing is same as TIME PRICE SETUP. In this pricing we added one field as below:

Free time

Description: You can set here N minutes, if you want to give free time for traffic time. It means You will not charge for traffic time and after that charge apply accordingly to set pricing.

Example: if you want to set as 7 mins free traffic time.

Free time: 7 mins.

So, in this case if total traffic time is **10 mins** in booking, then charges will count on **3 mins = 10 mins – 7 mins (Free time)**

Minimum Fees Setup

Description: This is the minimum charge that a customer will pay for a booking. If the total calculated fare (base fare + distance charge + time charge + waiting charge + surge charge + extra charges + more charges...) is less than this minimum fee, the customer is charged the minimum fee instead.

Minimum Fees Apply On

Description: The "Apply On" setting allows you to specify which pricing models the minimum fare should apply to. This is particularly useful for ensuring that each ride is profitable while also being fair to customers. By selectively applying minimum fares, the service can effectively manage financial outcomes and customer expectations across different segments of the market. Here we list out all prices (Booking Fees, Distance Price, Time Price, Waiting Time Price, Stop Waiting Time Price, Traffic Time Price, Surge Price). Admin can choose multiple prices in that apply Minimum fees.

Example:

Apply On: Apply On Booking Fees, Distance Price, Time Price

Minimum Fees

Description: The price charged customer if total of selected prices is less than minimum fees.

Example:

Minimum Fees: \$10.

Drivers Profit in Minimum fees amount:

Description: The absolute amount of the minimum fee that will go to the driver.

Example: If the minimum fee is \$10 and the driver's profit is set \$8, the driver will earn \$8 from the minimum fee.

Example: If the minimum fee for a ride is set at \$10.00 and the total calculated fare based on Apply on (Booking Fees \$1, Distance Price \$4.5, Time Price \$2.4) only \$7.9, the customer will be charged the minimum fee of \$10.00. Driver will earn on this \$8.

How It Works

Selectable Pricing Models: The admin can choose from various pricing models such as distance-based, time-based, waiting-based, or surge price pricing where the minimum fare rule should be applied.

Integration into Pricing Strategy: Once selected, these pricing models will include a minimum charge that must be met or exceeded, regardless of the actual calculated fare based on distance, time, or other factors.

Example Scenarios of "Apply On" Setting

Distance-Based Pricing:

Scenario: For shorter trips where the calculated fare based on distance might fall below a profitable margin.

Implementation: If the "Apply On" setting includes distance-based pricing, any ride where the distance calculation results in a fare less than the minimum will instead charge the minimum fare. This ensures each trip covers basic operational costs.

Time-Based Pricing:

Scenario: During heavy traffic conditions, where the time taken for a trip significantly increases but the distance does not correspond to higher earnings.

Implementation: By applying the minimum fare to time-based pricing, trips that take longer but cover less distance will still meet a minimum revenue threshold, compensating drivers fairly for their time.

TAX SETTINGS

This section details the dynamic tax management system implemented within our on-demand product. This system provides the flexibility to apply various taxes to different user roles and pricing components, ensuring accurate billing and compliance with regional tax regulations.

- **Multiple Tax Application per Transaction:** The system supports the application of multiple taxes to a single transaction. This is essential for regions with layered tax structures or when different taxes apply to different aspects of the service.
- **Automated Tax Calculation:** The system automatically calculates tax amounts based on configured rates and selected pricing components.
- **Dynamic Tax Updates:** The system allows for real-time updates to tax rates and rules, ensuring compliance with changing regulations.

Taxes can be applied differently based on the user's role:

- **Customer:** Taxes applied to the customer's total bill.
- **Driver/Service Provider:** Taxes applied to the driver's earnings or commissions.
- **Corporate Clients:** Customized tax settings for business accounts.
- **Partners:** Tax considerations for collaborative partners.

Calculation of Tax for all above user's is same; some tax applies on invoice or earning depend on which users there.

The system allows the definition of multiple tax types that added in country, such as: Value Added Tax (VAT), Goods and Services Tax (GST), Sales Tax, Service Tax, Local Taxes, Other region-specific taxes.

Each tax type is associated with a configurable rate (e.g., 5%, 10%, 15%).

How to add Tax on Customer

Tax Selection Dropdown:

- **Dropdown:** A dropdown menu containing a list of available taxes (e.g., GST [5%], SGST [10%]).
- **Functionality:** Allows admins to select the tax to apply.

Apply On Selection:

- **Dropdown/Multi-Select:** A dropdown or multi-select field to choose the pricing components to which the selected tax should be applied.
- **Options:**
 - **Booking Fees:** Tax applied to the base booking fee.
 - **Distance Price:** Tax applied to the price calculated based on distance.
 - **Time Price:** Tax applied to the price calculated on total time.
 - **Waiting Time Price:** Tax applied to the price calculated for waiting time.
 - **Stop Waiting Time Price:** Tax applied to the price calculated for stop waiting time.
 - **Traffic Time Price:** Tax applied to the price calculated for stop waiting time.
 - **Minimum Fees:** Tax applied to the minimum fare.
 - **City To City Price:** Tax applied to the city-to-city fixed price.
 - **Zone To Zone Price:** Tax applied to the zone-to-zone fixed price.
 - **Airport Price:** Tax applied to fares related to airport trips.
 - **Surge Price:** Tax applied to surge fares.
 - **Cancellation Price:** Tax applied to the Cancellation Price
 - **Bid Price:** Tax applied to the Bid price.

- **Functionality:** Allows admins to specify which parts of the fare are subject to the selected tax.

Save Button:

- **Button:** Click to Save button you can save record.
- **Functionality:** Saves the applied tax settings.

Tax List Table:

- **Columns:**
 - **Tax Name:** Displays the name of the tax (e.g., GST [5%], SGST [10%]).
 - **Apply On:** Displays the pricing components to which the tax is applied (e.g., Booking Fees | Distance Price).
 - **Action:** Displays action buttons for editing or deleting the tax rule.
- **Rows:** Each row represents a configured tax rule.
- **Functionality:** Displays the currently configured tax rules and allows admins to manage them.
- **Action Buttons:**
 - **Edit Button:** Allows admins to edit the tax rule.
 - **Delete Button:** Allows admins to delete the tax rule.

Example Scenario: Multiple Taxes on a Customer Transaction

Let's illustrate how multiple taxes are applied to a customer transaction:

- **Transaction Details:**
 - Booking Price: \$5
 - Distance Price: \$15
 - Time Price: \$10
- **Tax Configuration:**

- GST: 8% (applied to booking, distance, and time prices)
- Local Service Tax: 2% (applied to distance and time prices only)
- **Tax Calculation:**
 - **GST Calculation:**
 - Total GST Taxable Amount: \$5 (Booking) + \$15 (Distance) + \$10 (Time) = \$30
 - GST Amount: $\$30 * 0.08 = \2.40
 - **Local Service Tax Calculation:**
 - Local tax taxable amount: \$15 (Distance) + \$10 (Time) = \$25
 - Local Service Tax Amount: $\$25 * 0.02 = \0.50
 - **Total Tax Calculation:**
 - Total Tax Amount: $\$2.40$ (GST) + $\$0.50$ (Local Service Tax) = \$2.90
 - **Total Customer Cost:**
 - Total Cost: $\$5$ (Booking) + $\$15$ (Distance) + $\$10$ (Time) + $\$2.90$ (Total Tax) = \$32.90
- **Result:**
 - The customer's final bill will include a breakdown of the booking, distance, and time prices, as well as the separate GST and Local Service Tax amounts, totalling \$32.90.

Implementation Considerations:

- **Accuracy:** Ensure tax calculations are precise to comply with regulations and maintain customer trust.

- **Regional Compliance:** Adapt the system to the specific tax laws of each region where you operate.
- **Transparency:** Provide clear breakdowns of tax amounts on invoices and receipts.
- **Updates:** Keep tax rates and rules up to date to reflect changes in legislation.
- **Scalability:** The system must be able to handle a growing number of transactions and tax configurations.
- **User Interface:** The system should have a user-friendly interface for managing tax settings.
- **Error Handling:** Implement robust error handling to prevent incorrect tax calculations.

Example: Driver's Earnings and Tax Calculation

Scenario:

- A customer's total fare for a service request is \$50.
- The driver's profit is set at 80% of the total fare.
- A "Driver Tax" of 10% is applied to the driver's profit.

Calculation:

1. Driver's Gross Earnings (80% of Total Fare):

- a. Driver's Gross Earnings = Total Fare * 80%
- b. Driver's Gross Earnings = $\$50 * 0.80 = \40

2. Driver Tax Calculation:

- a. Driver Tax Amount = Driver's Gross Earnings * 10%
- b. Driver Tax Amount = $\$40 * 0.10 = \4

3. Driver's Net Earnings:

- a. Driver's Net Earnings = Driver's Gross Earnings - Driver Tax Amount
- b. Driver's Net Earnings = $\$40 - \$4 = \$36$

Result:

- The driver's gross earnings, representing 80% of the \$50 total fare, are \$40.
- A \$4 tax (10% of \$40) is applied to the driver's earnings.
- The driver's net earnings after the tax are \$36.

Important Notes:

- **Percentage-Based Earnings:**
 - This example demonstrates how to calculate driver earnings based on a percentage of the total fare.

- **Tax Application:**
 - The tax is applied directly to the driver's calculated earnings.
- **Regional Compliance:**
 - Always ensure that your tax calculations and reporting comply with the specific tax regulations of the regions where you operate.
- **Platform Fees:**
 - If you have platform fees, those need to be calculated before the driver earnings are calculated.

Invoice Example: Corporate Client with Customized Tax Settings

Scenario:

- **Corporate Client:** "ASDF Corporation"
- **Service Provided:** Transportation service for employees.
- **Service Details:**
 - Booking Fee: \$10
 - Distance Travelled: 50 km
 - Distance Rate: \$0.80/km
 - Waiting Time: 30 minutes
 - Waiting Time Rate: \$0.20/minute
- **Corporate Tax Settings:**
 - Corporate GST: 5% (applied to booking fee and distance price)
 - Corporate Service Tax: 3% (applied to waiting time price)

Item Description	Quantity/Distance/Time	Rate	Amount
Booking Fee	1	\$10	\$10.00
Distance Travelled	50 km	\$0.80/km	\$40.00
Waiting Time	30 minutes	\$0.20/minute	\$6.00
Subtotal			\$56.00

Taxes:			
Corporate GST (5%)	Booking + Distance		\$2.50
Corporate Service Tax (3%)	Waiting Time		\$0.18
Total			\$58.68

Example Scenario: Revenue Sharing with a Partner

Scenario:

- You have a partnership with a logistics company that provides delivery services.
- The agreement is that the logistics company receives 70% of the delivery fee, and your platform receives 30%.
- The delivery fee for a specific transaction is \$100.
- A 10% Partner Tax is applied to the logistics company's earnings.

Calculation:

1. Partner's Revenue Share:

- a. Partner's Revenue Share = Delivery Fee * 70%
- b. Partner's Revenue Share = \$100 * 0.70 = \$70

2. Partner Tax Calculation:

- a. Partner Tax Amount = Partner's Revenue Share * 10%
- b. Partner Tax Amount = \$70 * 0.10 = \$7

3. Partner's Net Earnings:

- a. Partner's Net Earnings = Partner's Revenue Share - Partner Tax Amount
- b. Partner's Net Earnings = \$70 - \$7 = \$63

Custom Price

This section describes the custom pricing feature, which allows administrators to define and apply additional pricing components beyond the standard booking, distance, time, and waiting time prices. This feature provides flexibility to accommodate unique service offerings, promotional arrangements, and tax considerations.

Functionality:

- **Custom Pricing Definition:**
 - Administrators can add an arbitrary number (N) of custom pricing components.
 - Each custom price component is defined by:
 - **Title/Name:** Admin can select title from Dropdown. You can add multiple titles on admin area.
 - **Custom Type:**
 - Other: General custom charge.
 - Additional Stop: Charge for extra stops during a trip.
 - Driver: Charge determined by the driver.
 - Toll: Toll charge, determined by an API or driver input.
 - **Price:** The amount the user (customer) is charged.
 - **Driver Profit:** The amount the driver earns from this custom price.
 - **Tax Selection:** The tax or taxes that apply to this custom price.
 -
- **Absolute and Percentage Options:**
 - Both the "Price" and "Driver Profit" can be set as either:
 - **Absolute Value:** A fixed monetary amount.
 - **Percentage:**

- For "Price", the percentage is calculated based on the total fare.
 - For "Driver Profit," the percentage is calculated based on the custom price itself.
- **Application:**
 - These custom prices are applied in addition to the standard pricing components.
- **When apply this:**
 - The custom pricing dialog box appears when the driver ends the trip.
- **Flexibility:**
 - This feature allows for a wide range of pricing scenarios, including:
 - Service fees
 - Handling charges
 - Snacks
 - Wi-Fi
 - Drinking water / Newspaper
 - Extra charges

Configuration Options:

- **Custom Type:**
 - **Other:** Administrator sets the price and driver profit.
 - **Additional Stop:** Administrator sets the price and driver profit. This charge applies if a customer requests an additional stop during the trip.
 - **Meet and Greet:** Administrator sets the price and driver profit.
 - **Driver:** Driver sets the price. Administrator sets the driver profit.
 - **Toll:**

- If a toll API is integrated and working, the toll amount is automatically fetched.
 - If the toll API is unavailable or fails, the driver is prompted to enter the toll amount.
 - Administrator sets the driver profit.
- **Price:**
 - **Absolute:** Enter a fixed monetary value (e.g., \$5, \$10).
 - **Percentage:** Enter a percentage value (e.g., 10%, 20%). The percentage will be calculated based on the total fare.
- ***Driver Defined Price:*** If the Custom Type is 'Driver' or 'Toll', this field is disabled for the administrator. The driver will enter this value when ending the trip.
- **Driver Profit:**
 - **Absolute:** Enter a fixed monetary value (e.g., \$3, \$7).
 - **Percentage:** Enter a percentage value (e.g., 70%, 80%). The percentage will be calculated based on the custom price.
- ***Driver Profit Calculation:*** * If the Custom Type is 'Driver' or 'Toll', the driver-defined price will be used for this calculation.
- **Tax Selection:**
 - Select one or more taxes to apply to the custom price. The system should allow the selection of multiple taxes.

Example Scenarios:

Example 1: Service Fee with Tax (Other Type - Admin Defined)

- **Scenario:** An administrator adds a "Service Fee" of \$5, with a driver profit of \$3, and applies a GST of 10%.
- **Configuration:**
 - Custom Type: Other
 - Custom Price Name: Service Fee

- Price: \$5 (Absolute)
- Driver Profit: \$3 (Absolute)
- Tax Selection: GST (10%)
- **Calculation:**
 - Customer is charged an additional $\$5 + (\$5 * 0.10) = \$5.50$.
 - Driver earns an additional \$3.

Example 2: Additional Stop (Additional Stop Type - Admin Defined)

- **Scenario:** An administrator adds an "Additional Stop" charge of \$7, with a driver profit of 100%. A customer requests an additional stop.
- **Configuration:**
 - Custom Type: Additional Stop
 - Custom Price Name: Additional Stop
 - Price: \$7 (Absolute)
 - Driver Profit: 100% (Percentage)
 - Tax Selection: None
- **Calculation:**
 - Customer is charged an additional \$7.
 - Driver earns $\$7 * 1.00 = \7 .

Example 3: Toll (Toll Type - Driver Defined)

- **Scenario:**
 - A driver encounters a toll road during a trip.
 - The toll API is unavailable.
 - The driver enters \$2 as the toll fee.
 - The administrator has configured a "Toll" custom price with a driver profit of 100%.

- **Configuration:**
 - Custom Type: Toll
 - Custom Price Name: Toll
 - Price: \$2 (Driver Input)
 - Driver Profit: 100% (Percentage)
 - Tax Selection: GST (5%)
- **Calculation:**
 - Driver enters \$2 as the toll price.
 - Customer is charged an additional $\$2 + (\$2 * 0.05) = \$2.10$
 - Driver earns $\$2 * 1.00 = \2 .

Example 4: Driver Gratuity (Driver Type - Driver Defined)

- **Scenario:** A driver provides excellent service, and the customer wants to add a \$5 tip. The administrator has set up a "Driver Gratuity" custom price, and the driver receives 100% of the tip.
- **Configuration:**
 - Custom Type: Driver
 - Custom Price Name: Driver Gratuity
 - Price: \$5 (Driver Input)
 - Driver Profit: 100% (Percentage)
 - Tax Selection: None
- **Calculation:**
 - Driver enters \$5 as the tip price.
 - Customer is charged an additional \$5.
 - Driver earns $\$5 * 1.00 = \5 .

Example 5: Toll with API (Toll Type - API Driven)

- **Scenario:**
 - A driver encounters a toll road during a trip.

- The toll API is available and returns a toll fee of \$3.50.
- The administrator has configured a "Toll" custom price with a driver profit of 100%.
- **Configuration:**
 - Custom Type: Toll
 - Custom Price Name: Toll
 - Price: \$3.50 (API Input)
 - Driver Profit: 100% (Percentage)
 - Tax Selection: GST (5%)
- **Calculation:**
 - The toll API provides \$3.50 as the toll price.
 - Customer is charged an additional $\$3.50 + (\$3.50 * 0.05) = \$3.68$
 - Driver earns $\$3.50 * 1.00 = \3.50

Airport Price

This section describes the airport pricing features, which allow administrators to define specific pricing rules for trips originating from or destined to airports.

Add Fixed Price

- **Functionality:** This feature allows setting a fixed price for trips between specific zones.
- **Configuration Options:**
 - **From Zone:** A list of airport and city areas.
 - **To Zone:** A list of airport and city areas.
 - **Price:** The fixed price for the trip.
 - **Driver Profit:** The amount the driver earns from this fixed price.

Add Pickup Price

- **Functionality:** This feature allows setting a specific price for pickups from a defined airport.
- **Configuration Options:**
 - **Airport:** A list of airport and city areas.
 - **Price:** The price for the airport pickup.
 - **Driver Profit:** The amount the driver earns from this pickup price.
 - **Waiting Time:** The default waiting time included in the pickup price.
 - **Tax:** Multiple selections of taxes that apply to this price.

Example Scenarios

Example 1: Fixed Price

- **Scenario:** A ride from Airport A to City Center B has a fixed price of \$25, with the driver earning \$20.
- **Configuration:**

- From Zone: Airport A
- To Zone: City Center B
- Price: \$25
- Driver Profit: \$20
- **Calculation:**
 - Customer pays \$25 for the trip.
 - Driver earns \$20.

Example 2: Fixed Price with different zones

- **Scenario:** A ride from City Center B to Airport A has a fixed price of \$30, with the driver earning 80%.
- **Configuration:**
 - From Zone: City Center B
 - To Zone: Airport A
 - Price: \$30
 - Driver Profit: 80%
- **Calculation**
 - Customer pays \$30
 - Driver earns \$24

Example 3: Pickup Price

- **Scenario:** A pickup from Airport C has a base price of \$15, driver profit of \$12, 15 minutes of waiting time, and a 10% GST.
- **Configuration:**
 - Airport: Airport C
 - Price: \$15
 - Driver Profit: \$12
 - Waiting Time: 15 minutes free
 - Tax: GST (10%)

- **Calculation:**

- Customer pays $\$15 + (\$15 * 0.10) = \$16.50$.
- Driver earns \$12.
- The base price includes 15 minutes of free waiting time.

Example 4: Pickup Price with Multiple Taxes

- **Scenario:** A pickup from Airport D has a base price of \$20, driver profit of \$15, 20 minutes waiting time, and both GST (5%) and PST (3%) applied.
- **Configuration:**
 - Airport: Airport D
 - Price: \$20
 - Driver Profit: \$15
 - Waiting Time: 20 minutes
 - Tax: GST (5%), PST (3%)
- **Calculation:**
 - Customer pays $\$20 + (\$20 * 0.05) + (\$20 * 0.03) = \21.60
 - Driver earns \$15.
 - The base price includes 20 minutes of free waiting time.

Accessibility

This section describes the Accessibility Options feature, which allows administrators to define accessibility options that customers can select before booking a service.

Functionality

- Administrators can add multiple accessibility options.
- Customers can choose the accessibility options they require via the app before booking.
- Each accessibility option has a price and driver profit associated with it.

Configuration Options

- **Select Accessibility:** A list of accessibility options (e.g., WiFi, Snacks, Wheelchair, Baby Seat).
- **Set Price:** The price for the selected accessibility option.
 - Absolute: A fixed monetary value.
 - Percentage: A percentage of the total fare.
- **Driver Profit:** The amount the driver earns for providing the selected accessibility option.
 - **Percentage:** A percentage of the accessibility option price.
 - **Absolute:** A fixed monetary value.
- **Set Value Tax:** A list of taxes that can be applied to the accessibility option price. Administrators can select multiple taxes.

Example Scenarios

Example 1: Wheelchair Accessibility

- **Scenario:** An administrator adds a "Wheelchair" accessibility option with a fixed price and absolute driver profit.

- **Configuration:**
 - Select Accessibility: Wheelchair
 - Set Price: \$10 (Absolute)
 - Driver Profit: \$8 (Absolute)
 - Set Value Tax: GST (5%)
- **Calculation:**
 - If a customer selects the "Wheelchair" option, they are charged an additional $\$10 + (\$10 * 0.05) = \$10.50$
 - The driver earns \$8.

Example 2: WiFi Accessibility

- **Scenario:** An administrator adds a "WiFi" accessibility option with a percentage-based price and driver profit.
- **Configuration:**
 - Select Accessibility: WiFi
 - Set Price: 5% (Percentage)
 - Driver Profit: 100% (Percentage)
 - Set Value Tax: None
- **Calculation:**
 - If a customer selects the "WiFi" option and the total fare is \$20, they are charged an additional $\$20 * 0.05 = \1 .
 - The driver earns $\$1 * 1.00 = \1 .

Example 3: Baby Seat Accessibility with Multiple Taxes

- **Scenario:** An administrator adds a "Baby Seat" accessibility option with a fixed price and percentage-based driver profit, and applies multiple taxes.
- **Configuration:**
 - Select Accessibility: Baby Seat
 - Set Price: \$7 (Absolute)

- Driver Profit: 80% (Percentage)
- Set Value Tax: GST (10%), PST (8%)
- **Calculation:**
 - If a customer selects the "Baby Seat" option, they are charged an additional $\$7 + (\$7 * 0.10) + (\$7 * 0.08) = \8.26
 - The driver earns $\$7 * 0.80 = \5.60

Example 4: Snacks Accessibility

- **Scenario:** An admin adds "Snacks" as an accessibility option. The price is set at \$3 (absolute) and the driver profit is \$2 (absolute).
- **Configuration:**
 - Select Accessibility: Snacks
 - Set Price: \$3 (Absolute)
 - Driver Profit: \$2 (Absolute)
 - Set Value Tax: No tax
- **Calculation:**
 - The customer is charged an extra \$3.
 - The driver earns \$2.

Bid Price and Fixed Price Ride

In a bid-based fare system, both customers and drivers can propose a fare for a specific trip. The final fare is determined based on the agreed-upon bid. This system offers flexibility and allows for dynamic pricing based on factors like demand, traffic, and distance.

Bid Price Setup

- **Functionality:** This feature allows for setting up when bid-based pricing apply, where admin can set drivers profit.
- **Configuration Options:**
 - **Driver Profit:** The amount the driver earns from the bid price.
 - Can be an absolute value or a percentage of the bid price.
 - **Add Additional Charges:** Select additional charges to be included in the final price.
 - Waiting Time Price
 - Stop Waiting Time Price
 - Traffic Time Price

Fixed Price Ride

- **Functionality:** This feature allows setting a added extra charges on fixed price for a ride.
- **Configuration Options:**
 - **Add Additional Charges:** Select additional charges to be included in the final price.
 - Waiting Time Price
 - Stop Waiting Time Price
 - Traffic Time Price

Example Scenarios

Example 1: Bid Price Setup

- **Scenario:**
 - Drivers bid for a ride. The winning bid is \$15.
 - The driver profit is set at 80%.
 - The admin selects "Waiting Time Price" and "Traffic Time Price" as additional charges.
- **Configuration:**
 - Driver Profit: 80%
 - Add Additional Charges: Waiting Time Price, Traffic Time Price
- **Calculation:**
 - Driver earns $\$15 * 0.80 = \12 .
 - Final price = $\$15 + \text{Waiting Time Price} + \text{Traffic Time Price}$

Example 2: Fixed Price Ride

- **Scenario:**
 - The fixed price for a ride is \$20.
 - The admin selects "Stop Waiting Time Price" as an additional charge.
- **Configuration:**
 - Add Additional Charges: Stop Waiting Time Price
- **Calculation:**
 - Final price = $\$20 + \text{Stop Waiting Time Price}$

Example 3: Bid Price with Absolute Driver Profit

- **Scenario:**
 - Drivers bid for a ride. The winning bid is \$25.
 - Driver profit is set at \$20.
 - The admin selects "Waiting Time Price" as an additional charge.
- **Configuration:**

- Driver Profit: \$20
- Add Additional Charges: Waiting Time Price
- **Calculation:**
 - Driver earns \$20
 - Final price = \$25 + Waiting Time Price

Example 4: Fixed Price Ride with Multiple Additional Charges

- **Scenario:**
 - The fixed price for a ride is \$30.
 - The admin selects "Waiting Time Price", "Stop Waiting Time Price", and "Traffic Time Price" as additional charges.
- **Configuration:**
 - Add Additional Charges: Waiting Time Price, Stop Waiting Time Price, Traffic Time Price
- **Calculation:**
 - Final Price = \$30 + Waiting Time Price + Stop Waiting Time Price + Traffic Time Price

Cancellation Policy for Customer

Apply Cancellation Policy

- **Description:**

This setting allows the admin to enable or disable cancellation charges. It governs whether a fee is applied to a customer's account if they cancel a ride after booking.

- **Functionality:**

Enabled/Disabled:

When enabled, customers will be subject to a cancellation fee under conditions specified in other settings (like free cancellation time and defined radius). When disabled, no cancellation fees will be applied regardless of when or where the customer cancels the booking.

- **Example:**

If the cancellation policy is enabled, a customer who cancels a ride five minutes after booking may incur a fee if they cancel past the free cancellation window.

Apply Cancellation Fees (Active/Inactive):

- **Description:**

A toggle switch to specifically enable or disable the application of cancellation fees (independent of the overall cancellation charge system).

- **Functionality:**

Enabled/Disabled:

When enabled, customers will be charged cancellation fees that define by admin.

- **Example:**

If "Apply Cancellation Charges for Customer?" is "Active," but "Apply Cancellation Fees" is "Inactive," the system may still track cancellations but won't apply fees.

Fees Type (% / Absolute) with Value (Fees):

- **Description:**

A dropdown to select whether the cancellation fee is a percentage of the trip fare or an absolute fixed amount. A text field to enter the numerical value of the cancellation fee, based on the selected "Fees Type."

- **Example:**

Selecting "%" allows setting a fee as a percentage of the total trip fare. Selecting "Absolute" allows setting a fixed monetary value. If "Fees Type" is "%" and "Set Value" is "20," the cancellation fee will be 20% of the trip fare. If "Fees Type" is "Absolute" and "Set Value" is "5," the cancellation fee will be a fixed 5.

Free Cancellation Time in Minutes

Description:

This setting determines whether customers are allowed a specific window of time after booking during which they can cancel their ride without incurring any fees. Specifies the length of the free cancellation period in minutes.

Functionality:

Admins set a specific number of minutes that define the free cancellation window, at that duration is set during which no cancellation fees will be charged. If set 0 min, customers may be

charged a cancellation fee immediately after booking if they decide to cancel.

Example:

If free cancellation time is set to 5 minutes, customers can cancel their ride within 5 minutes of booking without a charge. After this period, cancellation fees apply.

Define Radius on Cancellation

Description:

Determines a geographical radius within which cancellation charges apply if the driver has already arrived or is very close to the pickup location.

Functionality:

Enabled/Disabled:

When enabled, customers will be subject to a cancellation fee under conditions specified defined radius. When disabled, will not check radius on cancellation fees.

Radius Value:

Admins set a specific distance in meters that defines the radius around the pickup point. If the driver enters this radius and then the customer cancels, a fee will be charged.

Example:

If the radius is set to 500 meters, and the driver reaches within 500 meters of the pickup point, then any cancellation by the customer will incur a fee.

Scenario Examples

Scenario 1:

The cancellation policy is turned on, with a free cancellation time of 5 minutes and a defined radius of 300 meters for cancellations. A customer books a ride but cancels it 4 minutes later. In this case, no fee is charged since the cancellation occurred within the free period.

Scenario 2:

The same settings apply, but the customer cancels the ride after the driver is already within 300 meters of the pickup location, and it's been 6 minutes since the booking. Here, a cancellation fee would be applied because it's past the free cancellation window, and the driver is close to the pickup point.

Driver Profit

Description:

Allows the admin to set a portion of the cancellation fee that goes to the driver as compensation.

Functionality:

Absolute or Percentage:

The driver profit can be a fixed amount or a percentage of the cancellation fee.

Example: The driver receives \$10 of a \$15 cancellation fee.

Example 2: The driver receives 60% of a \$25 fee.

Cancel Up to Status

Description:

This setting determines up to which ride status the customer can cancel their booking from their app. After reaching this status, the cancel button is hidden or disabled.

Functionality:

Status Options:

Admins can choose from different ride statuses, such as "Requested," "Accepted," or "Driver Arriving," beyond which the cancel button will no longer be available to the customer.

Example:

Ride Requested Status:

If the "Cancel Up to Status" is set to "Requested," the customer can only cancel the ride while it is still pending driver acceptance.

Driver Arriving Status:

If set to "Driver Arriving," customers can cancel their ride up until the driver is very close to the pickup point, after which the button will be removed.

Apply Cancellation Charge From Status

Description:

Specifies from which ride status the cancellation fee will be charged if the customer cancels their booking.

Functionality:

Status Options:

Admins can choose the status from which a cancellation fee applies, such as "Accepted," "Driver Arriving," or "Arrived."

Example:

Accepted Status:

If the cancellation fee is applied from "Accepted," any customer who cancels after the driver has accepted the ride request will be charged.

Driver Arriving Status:

If set to "Driver Arriving," any cancellations occurring once the driver is on their way to the pickup point will incur a fee.

Apply On

Description:

Allows admins to specify which pricing structures will have cancellation fees applied. The admin can select multiple pricing models, such as distance price, time price, or other pricing structures (Booking Fees, Distance Price, Time Price, Waiting Time Price, Minimum Fees, City To City Price, Zone To Zone Price, Airport Price), ensuring the cancellation fee is appropriate for the specific type of ride.

Functionality:

Multiple Pricing Models: Admins can choose one or more pricing models that should incur cancellation fees. This ensures a fair application of fees based on the type of cost incurred.

Examples:

Distance Price:

If a ride's fare is primarily based on distance (e.g., longer trips or intercity rides), the cancellation fee will apply to these trips.

Time Price:

For services where the fare is based on the duration of the ride, the cancellation fee will also apply to these bookings if cancelled after a specified stage.

Other Price:

This can include special services, such as airport pickups or rental cars, which have different pricing structures, ensuring the fee reflects the cost or demand associated with those services.

Scenario Examples:

Suppose a customer book an intercity trip (which uses a distance pricing model). The driver accepts the ride and starts driving towards the pickup location. If the "Apply Cancellation Charge From Status" is set to "Driver Arriving," and the "Apply On" setting includes "Distance Price," the customer will incur a cancellation fee if they cancel once the driver is within the specified radius of the pickup location.

Peak Hours Cancellation Charges

Description:

This setting allows the admin to configure specific cancellation fees for rides cancelled during peak hours. During these high-demand periods, a higher fee ensures that drivers are compensated fairly for potential losses due to last-minute cancellations.

Functionality:

Day-Wise Slots:

Admins can define multiple slots per day for peak hours, setting both start and end times to ensure accurate identification of high-demand periods.

Cancellation Fee and Driver Profit:

For each slot, a specific cancellation fee is applied, and the admin can set the driver's share either as an absolute amount or a percentage of the fee.

Edit/Delete:

Admins can easily edit or delete specific slots to accommodate changing demand patterns or operational adjustments.

Configuration Example

Day-Wise Peak Hour Slots:

Monday-Friday:

Morning Slot: 7 AM - 9 AM

Evening Slot: 5 PM - 7 PM

Saturday-Sunday:

Afternoon Slot: 12 PM - 2 PM

Cancellation Fee and Driver Profit Setup:

Morning Slot:

During the weekday morning peak hour slot (7 AM - 9 AM), the cancellation fee is set to \$10, with a driver profit of \$6.

Evening Slot:

For weekday evenings (5 PM - 7 PM), the cancellation fee is \$15, with a driver profit of \$9.

Weekend Afternoon Slot:

On Saturday and Sunday afternoons (12PM - 2PM), the cancellation fee is \$8, with a driver profit of \$5.

Detailed Explanation of Schedule Booking Cancellation Charge

Apply Cancellation Charge for Scheduled Booking

Description:

This switch determines whether cancellation charges apply to scheduled bookings. It can be toggled on or off by the admin.

Functionality:

Enabled:

If enabled, customers will incur a cancellation fee when cancelling a scheduled booking within the time frames defined in the slots.

Disabled:

If disabled, customers can cancel scheduled bookings without incurring any fee.

State: Before Hours Period

Description:

Determines the type of time window during which cancellation charges apply.

Functionality:

Before Hours Period:

The fee applies if the customer cancels their scheduled booking before a defined time period.

Example:

If set to "Before 24 Hours," the cancellation fee will apply to cancellations that occur earlier than 24 hours before the scheduled pickup.

Hours

Description:

Specifies the number of hours for the "Within" or "Before" time window that governs the application of the cancellation fee.

Functionality:**Single Time Slot:**

For "Within," only one time slot can be set. If "Within 2 Hours" is chosen, the cancellation fee will apply if the customer cancels within 2 hours of the scheduled pickup.

Cancellation Charge**Description:**

Defines the amount of the cancellation fee, which can be set as either a percentage of the estimated ride cost or as an absolute value.

Functionality:**Absolute Value:**

A specific fee amount in currency is charged regardless of the estimated ride cost.

Example:

Set to \$15 if cancelled within 2 hours.

Percentage Value:

A fee based on a percentage of the estimated fare.

Example:

20% of the fare if cancelled within 2 hours.

Driver Profit**Description:**

Allows the admin to set a portion of the cancellation fee that goes to the driver as compensation.

Functionality:**Absolute or Percentage:**

The driver profit can be a fixed amount or a percentage of the cancellation fee.

Example: The driver receives \$10 of a \$15 cancellation fee.

Example 2: The driver receives 60% of a \$25 fee.

Edit/Delete Slots

Description:

Admins can edit or delete existing slots to refine the cancellation charges.

Functionality:

Edit:

Adjust the time window or change the fee to match current operational needs.

Delete:

Remove an obsolete slot if no longer needed.

Example Implementation

Scenario:

An admin wants to set up a cancellation policy for scheduled bookings with the following details:

Before Hours Period: 3 hours

Cancellation Charge: 15% of the fare

Driver Profit: 10% of the fare

Application:

A customer books a ride for 10 AM.

If the customer cancels the ride after 7:30 AM (before 2:30 hours of pickup), they will be charged 15% of the estimated fare.

The driver will receive 10% of the fare as their profit.

Cancellation Policy for Driver

Apply Cancellation Policy

- **Description:**

This setting allows the admin to enable or disable cancellation charges. It governs whether a fee is applied to a driver's account if they cancel a ride after accepting.

- **Functionality:**

Enabled/Disabled:

When enabled, driver will be subject to a cancellation fee under conditions specified in other settings (like free cancellation time and defined radius). When disabled, no cancellation fees will be applied regardless of when or where the driver cancels the booking.

- **Example:**

If the cancellation policy is enabled, a driver who cancels a ride five minutes after accepting may incur a fee if they cancel past the free cancellation window.

Apply Cancellation Fees (Active/Inactive):

- **Description:**

A toggle switch to specifically enable or disable the application of cancellation fees (independent of the overall cancellation charge system).

- **Functionality:**

Enabled/Disabled:

When enabled, driver will be charged cancellation fees that define by admin.

- **Example:**

If "Apply Cancellation Charges for Driver?" is "Active," but "Apply Cancellation Fees" is "Inactive," the system may still track cancellations but won't apply fees.

Fees Type (% / Absolute) with Value (Fees):

- **Description:**

A dropdown to select whether the cancellation fee is a percentage of the trip fare or an absolute fixed amount. A text field to enter the numerical value of the cancellation fee, based on the selected "Fees Type."

- **Example:**

Selecting "%" allows setting a fee as a percentage of the total trip fare. Selecting "Absolute" allows setting a fixed monetary value. If "Fees Type" is "%" and "Set Value" is "20," the cancellation fee will be 20% of the trip fare. If "Fees Type" is "Absolute" and "Set Value" is "5," the cancellation fee will be a fixed 5.

Free Cancellation Time in Minutes

Description:

This setting determines whether driver is allowed a specific window of time after accepting during which they can cancel their ride without incurring any fees. Specifies the length of the free cancellation period in minutes.

Functionality:

Admins set a specific number of minutes that define the free cancellation window, a that duration is set during which no cancellation fees will be charged. If set 0 min, driver may be

charged a cancellation fee immediately after accepting if they decide to cancel.

Example:

If free cancellation time is set to 5 minutes, driver can cancel their ride within 5 minutes of accepting without a charge. After this period, cancellation fees apply.

Define Radius on Cancellation

Description:

Determines a geographical radius within which cancellation charges apply if the driver has already arrived or is very close to the pickup location.

Functionality:

Enabled/Disabled:

When enabled, driver will be subject to a cancellation fee under conditions specified defined radius. When disabled, will not check radius on cancellation fees.

Radius Value:

Admins set a specific distance in meters that defines the radius around the pickup point. If the driver enters this radius and then the driver cancels, a fee will be charged.

Example:

If the radius is set to 500 meters, and the driver reaches within 500 meters of the pickup point, then any cancellation by the driver will incur a fee.

Scenario Examples

Scenario 1:

The cancellation policy is turned on, with a free cancellation time of 5 minutes and a defined radius of 300 meters for cancellations. A driver accepts a ride but cancels it 4 minutes later. In this case, no fee is charged since the cancellation occurred within the free period.

Scenario 2:

The same settings apply, but the driver cancels the ride after the he is already within 300 meters of the pickup location, and it's been 6 minutes since the booking. Here, a cancellation fee would be applied because it's past the free cancellation window, and the driver is close to the pickup point.

Cancel Up to Status

Description:

This setting determines up to which ride status the driver can cancel their booking from their app. After reaching this status, the cancel button is hidden or disabled.

Functionality:

Status Options:

Admins can choose from different ride statuses, such as "Requested", "Accepted", "In Route" or "Arrived at Pickup" beyond which the cancel button will no longer be available to the driver.

Example:

In Route Status:

If the "Cancel Up to Status" is set to "In Route," the driver can only cancel the ride while it is still pending In Route.

Arrived at Pickup Status:

If set to "Arrived at Pickup," driver can cancel their ride up until the he is very close to the pickup point, after which the button will be removed.

Apply Cancellation Charge from Status**Description:**

Specifies from which ride status the cancellation fee will be charged if the driver cancels their booking.

Functionality:**Status Options:**

Admins can choose the status from which a cancellation fee applies, such as "Accepted," "In Route," or "Arrived at Pickup."

Example:**Accepted Status:**

If the cancellation fee is applied from "Accepted," any driver who cancels after the he has accepted the ride request will be charged.

Arrived at Pickup Status:

If set to "Arrived at Pickup," any cancellations occurring once the he is on their way to the pickup point will incur a fee.

Apply On**Description:**

Allows admins to specify which pricing structures will have cancellation fees applied. The admin can select multiple pricing models, such as distance price, time price, or other pricing structures (Booking Fees, Distance Price, Time Price, Waiting Time

Price, Minimum Fees, City To City Price, Zone To Zone Price, Airport Price), ensuring the cancellation fee is appropriate for the specific type of ride.

Functionality:

Multiple Pricing Models: Admins can choose one or more pricing models that should incur cancellation fees. This ensures a fair application of fees based on the type of cost incurred.

Examples:

Distance Price:

If a ride's fare is primarily based on distance (e.g., longer trips or intercity rides), the cancellation fee will apply to these trips.

Time Price:

For services where the fare is based on the duration of the ride, the cancellation fee will also apply to these bookings if cancelled after a specified stage.

Other Price:

This can include special services, such as airport pickups or rental cars, which have different pricing structures, ensuring the fee reflects the cost or demand associated with those services.

Scenario Examples:

Suppose a driver accept an intercity trip (which uses a distance pricing model). The driver starts driving towards the pickup location. If the "Apply Cancellation Charge From Status" is set to "Driver Arriving," and the "Apply On" setting includes "Distance Price," the driver will incur a cancellation fee if they cancel once the he is within the specified radius of the pickup location.

Peak Hours Cancellation Charges

Description:

This setting allows the admin to configure specific cancellation fees for rides cancelled during peak hours. During these high-demand periods, a higher fee ensures that drivers are compensated fairly for potential losses due to last-minute cancellations.

Functionality:

Day-Wise Slots:

Admins can define multiple slots per day for peak hours, setting both start and end times to ensure accurate identification of high-demand periods.

Cancellation Fee and Driver Profit:

For each slot, a specific cancellation fee is applied, and the admin can set the driver's share either as an absolute amount or a percentage of the fee.

Edit/Delete:

Admins can easily edit or delete specific slots to accommodate changing demand patterns or operational adjustments.

Configuration Example

Day-Wise Peak Hour Slots:

Monday-Friday:

Morning Slot: 7 AM - 9 AM

Evening Slot: 5 PM - 7 PM

Saturday-Sunday:

Afternoon Slot: 12 PM - 2 PM

Cancellation Fee and Driver Profit Setup:

Morning Slot:

During the weekday morning peak hour slot (7 AM - 9 AM), the cancellation fee is set to \$10, with a driver profit of \$6.

Evening Slot:

For weekday evenings (5 PM - 7 PM), the cancellation fee is \$15, with a driver profit of \$9.

Weekend Afternoon Slot:

On Saturday and Sunday afternoons (12PM - 2PM), the cancellation fee is \$8, with a driver profit of \$5.

Detailed Explanation of Schedule Booking Cancellation Charge**Apply Cancellation Charge for Scheduled Booking****Description:**

If "Fees Type" is "%" and "Set Value" is "20," the cancellation fee will be 20% of the trip fare. If "Fees Type" is "Absolute" and "Set Value" is "5," the cancellation fee will be a fixed 5.

Free Cancellation Time in Minutes

Description:

This setting determines whether customers are allowed a specific window of time after booking during which they can cancel their ride without incurring any fees. Specifies the length of the free cancellation period in minutes.

Functionality:

Admins set a specific number of minutes that define the free cancellation window, at that duration is set during which no cancellation fees will be charged. If set 0 min, customers may be

charged a cancellation fee immediately after booking if they decide to cancel.

Example:

If free cancellation time is set to 5 minutes, customers can cancel their ride within 5 minutes of booking without a charge. After this period, cancellation fees apply.

Define Radius on Cancellation

Description:

Determines a geographical radius within which cancellation charges apply if the driver has already arrived or is very close to the pickup location.

Functionality:

Enabled/Disabled:

When enabled, customers will be subject to a cancellation fee under conditions specified defined radius. When disabled, will not check radius on cancellation fees.

Radius Value:

Admins set a specific distance in meters that defines the radius around the pickup point. If the driver enters this radius and then the customer cancels, a fee will be charged.

Example:

If the radius is set to 500 meters, and the driver reaches within 500 meters of the pickup point, then any cancellation by the customer will incur a fee.

Scenario Examples

Scenario 1:

The cancellation policy is turned on, with a free cancellation time of 5 minutes and a defined radius of 300 meters for cancellations. A customer books a ride but cancels it 4 minutes later. In this case, no fee is charged since the cancellation occurred within the free period.

Scenario 2:

The same settings apply, but the customer cancels the ride after the driver is already within 300 meters of the pickup location, and it's been 6 minutes since the booking. Here, a cancellation fee would be applied because it's past the free cancellation window, and the driver is close to the pickup point.

Driver Profit

Description:

Allows the admin to set a portion of the cancellation fee that goes to the driver as compensation.

Functionality:

Absolute or Percentage:

The driver profit can be a fixed amount or a percentage of the cancellation fee.

Example: The driver receives \$10 of a \$15 cancellation fee.

Example 2: The driver receives 60% of a \$25 fee.

Cancel Up to Status

Description:

This setting determines up to which ride status the customer can cancel their booking from their app. After reaching this status, the cancel button is hidden or disabled.

Functionality:

Status Options:

Admins can choose from different ride statuses, such as "Requested," "Accepted," or "Driver Arriving," beyond which the cancel button will no longer be available to the customer.

Example:

Ride Requested Status:

If the "Cancel Up to Status" is set to "Requested," the customer can only cancel the ride while it is still pending driver acceptance.

Driver Arriving Status:

If set to "Driver Arriving," customers can cancel their ride up until the driver is very close to the pickup point, after which the button will be removed.

Apply Cancellation Charge From Status

Description:

Specifies from which ride status the cancellation fee will be charged if the customer cancels their booking.

Functionality:

Status Options:

Admins can choose the status from which a cancellation fee applies, such as "Accepted," "Driver Arriving," or "Arrived."

Example:

Accepted Status:

If the cancellation fee is applied from "Accepted," any customer who cancels after the driver has accepted the ride request will be charged.

Driver Arriving Status:

If set to "Driver Arriving," any cancellations occurring once the driver is on their way to the pickup point will incur a fee.

Apply On

Description:

Allows admins to specify which pricing structures will have cancellation fees applied. The admin can select multiple pricing models, such as distance price, time price, or other pricing structures (Booking Fees, Distance Price, Time Price, Waiting Time Price, Minimum Fees, City To City Price, Zone To Zone Price, Airport Price), ensuring the cancellation fee is appropriate for the specific type of ride.

Functionality:

Multiple Pricing Models: Admins can choose one or more pricing models that should incur cancellation fees. This ensures a fair application of fees based on the type of cost incurred.

Examples:

Distance Price:

If a ride's fare is primarily based on distance (e.g., longer trips or intercity rides), the cancellation fee will apply to these trips.

Time Price:

For services where the fare is based on the duration of the ride, the cancellation fee will also apply to these bookings if cancelled after a specified stage.

Other Price:

This can include special services, such as airport pickups or rental cars, which have different pricing structures, ensuring the fee reflects the cost or demand associated with those services.

Scenario Examples:

Suppose a customer book an intercity trip (which uses a distance pricing model). The driver accepts the ride and starts driving towards the pickup location. If the "Apply Cancellation Charge From Status" is set to "Driver Arriving," and the "Apply On" setting includes "Distance Price," the customer will incur a cancellation fee if they cancel once the driver is within the specified radius of the pickup location.

Peak Hours Cancellation Charges

Description:

This setting allows the admin to configure specific cancellation fees for rides cancelled during peak hours. During these high-demand periods, a higher fee ensures that drivers are compensated fairly for potential losses due to last-minute cancellations.

Functionality:

Day-Wise Slots:

Admins can define multiple slots per day for peak hours, setting both start and end times to ensure accurate identification of high-demand periods.

Cancellation Fee and Driver Profit:

For each slot, a specific cancellation fee is applied, and the admin can set the driver's share either as an absolute amount or a percentage of the fee.

Edit/Delete:

Admins can easily edit or delete specific slots to accommodate changing demand patterns or operational adjustments.

Configuration Example

Day-Wise Peak Hour Slots:

Monday-Friday:

Morning Slot: 7 AM - 9 AM

Evening Slot: 5 PM - 7 PM

Saturday-Sunday:

Afternoon Slot: 12 PM - 2 PM

Cancellation Fee and Driver Profit Setup:

Morning Slot:

During the weekday morning peak hour slot (7 AM - 9 AM), the cancellation fee is set to \$10, with a driver profit of \$6.

Evening Slot:

For weekday evenings (5 PM - 7 PM), the cancellation fee is \$15, with a driver profit of \$9.

Weekend Afternoon Slot:

On Saturday and Sunday afternoons (12PM - 2PM), the cancellation fee is \$8, with a driver profit of \$5.

Detailed Explanation of Schedule Booking Cancellation Charge

Apply Cancellation Charge for Scheduled Booking

Description:

This switch determines whether cancellation charges apply to scheduled bookings. It can be toggled on or off by the admin.

Functionality:

Enabled:

If enabled, customers will incur a cancellation fee when cancelling a scheduled booking within the time frames defined in the slots.

Disabled:

If disabled, customers can cancel scheduled bookings without incurring any fee.

State: Before Hours Period

Description:

Determines the type of time window during which cancellation charges apply.

Functionality:

Before Hours Period:

The fee applies if the customer cancels their scheduled booking before a defined time period.

Example:

If set to "Before 24 Hours," the cancellation fee will apply to cancellations that occur earlier than 24 hours before the scheduled pickup.

Hours

Description:

Specifies the number of hours for the "Within" or "Before" time window that governs the application of the cancellation fee.

Functionality:**Single Time Slot:**

For "Within," only one time slot can be set. If "Within 2 Hours" is chosen, the cancellation fee will apply if the customer cancels within 2 hours of the scheduled pickup.

Cancellation Charge**Description:**

Defines the amount of the cancellation fee, which can be set as either a percentage of the estimated ride cost or as an absolute value.

Functionality:**Absolute Value:**

A specific fee amount in currency is charged regardless of the estimated ride cost.

Example:

Set to \$15 if cancelled within 2 hours.

Percentage Value:

A fee based on a percentage of the estimated fare.

Example:

20% of the fare if cancelled within 2 hours.

Driver Profit**Description:**

Allows the admin to set a portion of the cancellation fee that goes to the driver as compensation.

Functionality:**Absolute or Percentage:**

The driver profit can be a fixed amount or a percentage of the cancellation fee.

Example: The driver receives \$10 of a \$15 cancellation fee.

Example 2: The driver receives 60% of a \$25 fee.

Edit/Delete Slots

Description:

Admins can edit or delete existing slots to refine the cancellation charges.

Functionality:

Edit:

Adjust the time window or change the fee to match current operational needs.

Delete:

Remove an obsolete slot if no longer needed.

Example Implementation

Scenario:

An admin wants to set up a cancellation policy for scheduled bookings with the following details:

Before Hours Period: 3 hours

Cancellation Charge: 15% of the fare

Driver Profit: 10% of the fare

Application:

A customer books a ride for 10 AM.

If the customer cancels the ride after 7:30 AM (before 2:30 hours of pickup), they will be charged 15% of the estimated fare.

The driver will receive 10% of the fare as their profit.

Surge Pricing

Surge pricing, also known as dynamic pricing, is a strategy where prices are adjusted in real-time based on supply and demand. In the context of a ride-hailing or delivery service like Hyze, surge pricing typically increases fares during periods of high demand or low driver availability. But in Hyze you have to set Surge pricing according to time and week's day wise.

Factors Influencing Surge Pricing:

- **Time of Day:** Rush hours, late nights, weekends.
- **Location:** Areas with high demand (e.g., city centers, event venues).
- **Weather Conditions:** Heavy rain or snow.
- **Special Events:** Concerts, sporting events, festivals.
- **Driver Availability:** A shortage of available drivers.

Implementation:

- **Surge Price Toggle:**
 - A toggle switch to enable or disable surge pricing.
 - This allows admins to turn surge pricing on or off as needed.
- **Apply On:**
 - A multi-select field to specify which components of the fare surge pricing should apply to.
 - Booking Fees, Distance Price, Time Price, Waiting Time Price, Minimum Fees, City To City Price, Zone To Zone Price, Airport Price all price listed on Apply On.
- **Day of Week Selection:**
 - Tab for each day of the week (Sun, Mon, Tue, Wed, Thu, Fri, Sat).
 - Allows admins to specify which days of the week surge pricing rules apply.

- You might set surge pricing to be more aggressive on Friday and Saturday nights, or during weekday rush hours.
- a.
- **Time Slot Configuration:**
 - **Select Start Time:** A time picker to set the start time for the surge pricing period.
 - **Select End Time:** A time picker to set the end time for the surge pricing period.
 - These both parameters define the time window during which surge pricing is active.
 - You could set surge pricing to activate from 5:00 PM to 8:00 PM on weekdays to account for rush hour traffic.
 - **Factor:** A text field to enter the surge multiplier (e.g., 1.4).
 - Example: A surge factor of 1.5 means that the fare will be 1.5 times the normal rate. A surge factor of 2 means that the fare doubles.
 - **Add Button (+):** A button to add the configured time slot to the surge pricing rules.
- **Surge Slot List:**
 - A table displaying the configured surge pricing time slots.
 - **Start Time:** The start time of the surge period.
 - **End Time:** The end time of the surge period.
 - **Factor:** The surge multiplier for that period.
 - **Action:** Buttons to edit, delete or select zone for apply surge price the surge pricing rule.

Implementation surge zone wise:

- **Apply Surge on Whole Area?**

- This is a simple boolean (true/false) option. If true, the surge factor applies to all areas within your service region.
 - If false, then check zone wise multiplier.
 - Use Case: This is good for city wide events, or holidays.
- **List of Zone**
 - This allows you to define specific geographic zones within your service area.
 - **Example:** You might have zones for downtown, suburbs, or specific event venues.
 - You can select multiple zone and set multiple of that zone on selected time.
- **Set Factor Zone Wise:**
 - This parameter lets you apply different surge factors to different zones.
 - **Example:**
 - Downtown Zone: Surge factor 2.0 (high demand)
 - Suburban Zone: Surge factor 1.2 (moderate demand)
 - This Allows for very granular control of surge pricing.

Example Scenario:

- **Scenario 1: Friday Night Surge:**
 - Day of Week: Friday
 - Start Time: 10:00 PM
 - End Time: 2:00 AM
 - Surge Factor: 1.8
 - Apply Surge on Whole Area: True
- **Scenario 2: Event-Based Zone Surge:**
 - Day of Week: Saturday
 - Start Time: 6:00 PM

- End Time: 11:00 PM
- List of Zone: Stadium Zone
- Set Factor Zone Wise:
 - Stadium Zone: 2.5
- **Scenario 3: Rush Hour Zone Surge:**
 - Day of Week: Monday, Tuesday, Wednesday, Thursday, Friday
 - Start Time: 7:00 AM
 - End Time: 9:00 AM
 - List of Zone: Downtown Zone, Business Park Zone
 - Set factor Zone Wise:
 - Downtown Zone: 1.5
 - Business Park Zone: 1.3

Zone to Zone Fixed Pricing

This feature allows administrators to set fixed fares for trips between specific zones within a city. This is useful for pre-defined routes or areas where dynamic pricing might not be suitable or desired.

When a customer requests a ride between two zones with a defined fixed price, the app will display that price. The fixed price will override any other fare calculation methods (e.g., distance-based, time-based).

The driver will receive the calculated profit based on the set driver profit rule.

Elements:

- **Zone List:**
 - Administrators can define geographic zones within the service area/city and list all zones.
 - Zones can be created by Polygons (drawing shapes on a map).
- **From Zone Dropdown:**
 - **Dropdown:** A dropdown menu containing a list of defined zones within the city (e.g., "City centre," "Zoo", "Big Mall", "Bus Stand", "Dam").
 - **Functionality:** Allows administrators to select the starting zone for the fixed fare.
- **To Zone Dropdown:**
 - **Dropdown:** A dropdown menu containing a list of defined zones within the city (e.g., "City centre," "Zoo", "Big Mall", "Bus Stand", "Dam").
 - **Functionality:** Allows administrators to select the destination zone for the fixed fare.
- **Fixed Price Input:**

- Administrators can set a fixed price for trips between the selected zone pair.
- This price will be displayed to customers when they request a ride between those zones.
- **Provider Profit Input:**
 - Administrators can set the driver's profit fixed amount for the specific zone pair.
 - This ensures drivers are fairly compensated for trips between these zones.

Zon to Zone Fixed Fare List:

- **Columns:**
 - **From:** Displays the starting zone.
 - **To:** Displays the destination zone.
 - **Price:** Displays the fixed fare amount.
 - **Provider Profit:** Displays the driver's earnings.
- **Rows:** Each row represents a configured fixed fare rule.
- **Functionality:** Displays the currently configured fixed fare rules and allows administrators to manage them.
- **Action Buttons:**
 - **Edit Button:** Allows administrators to edit the fixed fare rule.
 - **Delete Button:** Allows administrators to delete the fixed fare rule.

Example Scenarios:

"City centre," "Zoo", "Big Mall", "Bus Stand"

- **Example 1: Fixed Fare Between Big Mall and Zoo**
 - **From Zone:** Big Mall
 - **To Zone:** Zoo
 - **Price:** 100 ₹

- **Provider Profit:** 80 ₹
- Result: Customers traveling from the Big Mall to the Zoo will pay a fixed fare of 100 ₹, and the driver will earn 80 ₹.
- **Example 2: Fixed Fare Between Zoo and Dam**
 - **From Zone:** Zoo
 - **To Zone:** Dam
 - **Price:** 130 ₹
 - **Provider Profit:** 120 ₹
 - Result: Customers traveling from the Zoo to the Dam will pay a fixed fare of 130 ₹, and the driver will earn 120 ₹.
- **Example 3: Editing a Fixed Fare Rule**
 - The administrator edits the "Big Mall to Zoo" rule.
 - The administrator changes the "Price" to 120 ₹ and the "Provider Profit" to 90 ₹.
 - Result: The fixed fare for the Big Mall to Zoo route is updated to 120 ₹, and the driver's earnings are updated to 90 ₹.
- **Example 4: Deleting a Fixed Fare Rule**
 - The administrator deletes the "Zoo to Dam" rule.
 - Result: The fixed fare for the Zoo to Dam route is removed from the system.

City-to-City Fixed Pricing

This feature enables administrators to set pre-defined fares for trips between specific cities, offering clear pricing for longer journeys.

Key Features:

1. "From" City Selection (Fixed Origin):

- a. The administrator is working within the context of a specific "from" city. This "from" city is implicitly set by the system's current city settings.
- b. This means, the pricing rules are being set from the context of that city.
- c. **Example:** If the administrator is working in the "Mumbai" city settings, they are setting prices for trips originating from Mumbai.

2. "To" City List (Dynamic Destination):

- a. When setting a price, the administrator is presented with a list of "to" cities.
- b. This "to" city list is populated based on the cities that have been enabled or configured within the application's city settings.
- c. **Example:** If the administrator is adding a price rule in Mumbai, the "to" city list might include Pune, Ahmedabad, Delhi, etc., based on which cities are configured in the system.

3. Fixed Price Setting:

- a. Administrators can set a fixed price for trips from the "from" city to each selected "to" city.
- b. This price is displayed to customers when they request a trip between these cities.

4. Driver Profit Setting:

- a. Administrators can set the driver's profit percentage or fixed amount for the specific city-to-city trip.

- b. This ensures drivers are fairly compensated for these longer journeys.

5. Edit/Delete Functionality:

- a. Administrators can edit existing city-to-city pricing rules to adjust fares or driver profits.
- b. Administrators can delete city-to-city pricing rules that are no longer needed.

6. Price Display and Application:

- a. When a customer requests a trip from the "from" city to a "to" city with a defined fixed price, the app will display that price.
- b. The fixed price overrides any other fare calculation methods (e.g., distance-based, time-based).
- c. The driver receives the calculated profit based on the set driver profit rule.

Example Scenario:

- **City Settings:**
 - Mumbai, Pune, Ahmedabad, Delhi are configured in the system.
- **Administrator Action:**
 - The administrator is working within the "Mumbai" city settings.
 - They are presented with a "to" city list containing Pune, Ahmedabad, Delhi.
 - They set the following pricing rules:
 - Mumbai to Pune: ₹2500 (Driver Profit: ₹2000)
 - Mumbai to Ahmedabad: ₹3500 (Driver Profit: ₹3000)
 - Mumbai to Delhi: ₹8000 (Driver Profit: ₹6000)
- **Customer Ride Request:**
 - A customer requests a trip from Mumbai to Ahmedabad.
 - The app displays a fixed fare of ₹3500.

- The driver receives ₹3000.
- **Example 1: Fixed Fare Between Rajkot and Ahmedabad**
 - **From City:** Rajkot, Gujarat, India
 - **To City:** Ahmedabad, Gujarat, India
 - **Price:** 1500 ₹
 - **Provider Profit:** 1300 ₹
 - **Result:** Customers traveling from Rajkot to Ahmedabad will pay a fixed fare of 1500 ₹, and the driver will earn 1300 ₹.
- **Example 2: Fixed Fare Between Surat and Vadodara**
 - **From City:** Surat, Gujarat, India
 - **To City:** Vadodara, Gujarat, India
 - **Price:** 1200 ₹
 - **Provider Profit:** 1000 ₹
 - **Result:** Customers traveling from Surat to Vadodara will pay a fixed fare of 1200 ₹, and the driver will earn 1000 ₹.
- **Example 3: Editing a Fixed Fare Rule**
 - The administrator edits the "Rajkot to Ahmedabad" rule.
 - The administrator changes the "Price" to 1600 ₹ and the "Provider Profit" to 1400 ₹.
 - **Result:** The fixed fare for the Rajkot to Ahmedabad route is updated to 1600 ₹, and the driver's earnings are updated to 1400 ₹.
